There are five py file for models and three py file for dimension reduction method.

For the three dimension reduction method file, some models use there methods at the bottom.

'data = data_pre[data_pre['string'].isin([0,1])]' can choose pairs, and 'A' replaced by '0', 'B' replaced by '1'. So if I choose pair 1: H and K, the code is 'data = data_pre[data_pre['string'].isin([7,10])]'.
